Q: Prove that a matrix  $A$  is symmetric  
Let  $A$  be an  $n \times n$  matrix. Let  $A$  have  $n$  distinct eigenvalues,  $a_1, a_2, \dots, a_n$ , and the corresponding eigenvectors be  $v_1, v_2, \dots, v_n$ . Then,  $A$  is symmetric if and only if:  $v_i^T A v_j = \lambda v_i^T v_j$  for all  $i, j$ .  
Prove this with examples. Thanks. A: There is no unique proof, you can prove it using  $\det \begin{bmatrix} v_1 & v_2 & \dots & v_n \\ A v_1 & A v_2 & \dots & A v_n \end{bmatrix}$  The LHS equals  $\det A \det v_i$  and the RHS equals  $\det v_i \det A$  Equating the LHS and RHS we get  $v_i^T A v_j = \lambda v_i^T v_j$ , so every proof is a proof. Hence we can say the proof is true if we are given the matrix  $A$  and eigenvalues  $a_i$  and the corresponding eigenvectors  $v_i$ . We can also prove it using a characteristic polynomial and calculating the polynomial in the eigenvalues. Hence, it is a proof which is purely mathematically rigorous.

Viridans streptococci: effects on human neutrophils. The adherence of viridans streptococci to human PMNs was measured by quantitative bacterial adhesion, and the effects of the bacteria on various function of the PMNs were studied. The quantitative bacterial adhesion was enhanced by incubation with PMNs, but only when the bacteria were in the exponential growth phase. In the stationary phase of growth the bacteria adhered only in small numbers. The addition of
