Multiple-stage pressurized exhaust gas aftertreatment systems are now commonly used on automotive vehicles to reduce the level of pollution that is exhausted to the environment from internal combustion engines. Such systems typically include a three-way catalyst to remove harmful pollutants from exhaust gas and a diesel particulate filter to trap soot particles in the exhaust gas. Combustion engine controllers can periodically enrich fuel mixture to the engine during engine operation to improve the regeneration of diesel particulate filters. The three-way catalyst in such systems must be able to store sufficient energy to oxidize unburned hydrocarbons and carbon monoxide, reducing the release of nitrogen oxides as a by-product of combustion of fuel in the engine. While the first stage of

exhaust gas treatment involves primarily the oxidation of unburned hydrocarbons and carbon monoxide, the third stage of treatment involves conversion of the nitrogen oxides into compounds that are less harmful and then reduction of these compounds into nitrogen and oxygen. Accordingly, two catalysts are typically required, a hydrocarbon oxidation catalyst to oxidize the hydrocarbons and carbon monoxide, and a nitrogen oxide conversion catalyst to convert the nitrogen oxides into harmless nitrogen and oxygen, but not hydrogen. To achieve three-way catalyst function at low temperature, it has been proposed to use an oxidation catalyst to oxidize hydrocarbons under lean conditions, and a nitrogen oxide conversion catalyst to oxidize hydrocarbons under rich conditions. The installation of such systems onto an engine assembly is typically complex, requiring the addition of routing conduits to provide appropriate exhaust gas flow paths and the use of a large number of fasteners to secure various components to a substrate or to each other. Each installation and access to the system for servicing or replacement of one or more of the components requires a large number of fasteners and tools, time, labor, and cost. Additionally, the number of exhaust pipe or conduit fittings and fasteners must be tightly controlled to retain the precious heat of the exhaust gas as it flows through the exhaust pipe from the engine to the exhaust gas aftertreatment system. Some aftertreatment systems are configured with a plurality of inlet and outlet conduits. The number of conduits, the lengths of the conduits, the physical locations of each conduit, the diameter and cross-sectional area of the conduits
