What's new in PIXASSO 2:

(Spoilers) As you may already know, Overclocked Remix has become an annual tradition for us. This year will be exceptionally different when we do two interdependent puzzles in just the span of a week. Yesterday (May 3rd) we did the puzzle, today we bring to you the Theory. Polygon Attack is a created by Manish Sanghani, the puzzle creator for some of our favourite games such as Elite: Dangerous, Deus Ex, Final Fantasy XI and Crackdown, one of my personal favourites. The guys at Manish Sanghani and Tyler Burns have given us a puzzle that you can solve by creating a polygon on the map and then by merging polygons, adding new nodes. The map that was initially created for the puzzle had just few polygons, with a little more space through the elimination of polygons, the complete picture is made available for anyone to solve. Let's see how to solve this puzzle. Polygon Attack Theory Analysis Our Puzzle was created with Ace of Spades, a Map Editor. Ace of Spades is a modification of the well-known Civilization Game Empire United, with extra units, different terrains and

features the possibility to build nodes. In brief, Ace of Spades allows us to build nodes anywhere on the map and also to attach constraints to the nodes you plan to build, so that if a node does not need the space you are about to create, the systems will automatically refrain the creation of that node. You will notice that by removing polygons from the map, the picture gets ambiguous. Often you can remove large numbers of polygons and still be able to recognize the structure of the map. This allows you to identify with less effort where to add more nodes and where to cut. We start with the smallest polygon which covers the outlines of the picture. We then merge polygons using Mask Edits and Duplicates. This way when we cannot recognize the map, it can still be hard to recognize the structure which might give us the clue to solving. Once we recognize the map as a grid, we start identifying what lines are connecting the map and we can eventually solve the puzzle. Manish's polygon map did not have a complicated grid, so it was not very easy to recognize. There are 13 polygons representing 14 nodes. We can remove one row and one column of polygons, thus generating new polygons

which has instead turned into a series of other victims. The group now opposes gun control because they believe that the NRA has successfully demonized the issue, and that gun control bills will not get "passed."
