The droplets are generally ejected through small nozzles at high speed toward the print medium and the droplets strike the surface of the print medium at an acute angle with respect to the

direction of droplet ejection. The speed of the droplet and the distance it travels varies with the pressure at which the droplet is ejected and the density of the droplet is related to this distance. The trajectories of the droplets after leaving the nozzle are affected by the surface tension of the ink, viscosity, and other factors, giving rise to the formation of bands and other structure in the printed image, along with creating discrete spots of ink that can vary in position. Due to its non-impact printing, low noise and low energy requirements, an inkjet printing system is more versatile than other non-impact printing methods and is a commonly used type of printing system. Further, inkjet printing inks and print media have been developed

that allow such inks to produce digital images that are indistinguishable in quality from images produced by conventional offset printing. However, inkjet printing is not without drawbacks. For example, inkjet printing
